                                                                                                                                                                                                                                                                        Region
 AAR54245
            The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (Wab) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                             Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-

Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with 9p120 and 8p41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARA4245 neutralises HIV1 gp120. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

This sequence represents the sequence of the JH6 gene clone, b7. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml, and binds mature gp120 determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection
                                                                                                                                                                                                             Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gpl20; clone; virus infectivity assay; precursor gpl60; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                      WH region of HIV neutralising MAb, IgG1 b7.

This sequence represents a fragment of the antibodies of the invention. The invention relates to the production of an anti-HV (human immunodificiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first ham the concentration of less than 70 mg/ml. The method for the polynucleotide encoding a heavy chain immunoglobulin anino acid sequence (which does not comprise the sequence represented by AAY98206) and a sequence; (b) inserting the first and second polynucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the main oacid sequences encoded by the polynucleotides to be expressed in the host cell; and (d) isolating the nost cell in conditions which allow light chain immunoglobulin anino acid sequences from the host cell. The anti-HIV gp-120 monoclonal antibody so used for providing passive immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and contains an are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV

in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunodlobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gp120 preferentially over HIV precursor glycoprotein gp120 preferentially over HIV precursor glycoprotein gp140 and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and
                                                                                                                                                                                                                                                     9

field isolates and provide useful information regarding the immunocempetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a munan polynucleotides derives from the fact that they are encoded by a nutibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of xenogenel or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derivations the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              142

                                                                                                                                                                                                  The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus lifectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV mare effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                        FODRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AAEA4246 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  142

The sequences given in AAW01233-60 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JH6 gene clone, b21. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for detection of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immundeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity tirre in an in virto virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (b) production of the antiboding a light chain immunoglobulin amino acid sequence cond polymuclectide sequences into a host cell; (c) maintaining the host cell in conditions which allow the host cell; (d) maintaining the polymuclectide sequences into a code sequence ancoded by the polymuclectides to be expressed in the host cell; and (d) isolating the antibode time the host cell. The antibodies to be expressed in the host cell; and (d) isolating the antibode time the cell. The immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 concentration of HIV present in the body or in body fluids by a manance of a human polymucleotide sequence and

The invention relates to a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gpi20 preferentially over HIV precursor glycoprotein gp160 and neutralises HIV and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a human polynuclectides sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly administered antibodies which is a problem commonly encountered when monoclonal antibodies of significant host immune response to the passively administered antibodies of sangement or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per min. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 51, 354, 354 and 35b have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of sillon go of antibody per ml. They can be used to provide passive timmunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 LEGSGAEVKKPGASVKVSCQASGYRFSNFTVHWVRQAPGQRFEWMGWINPYNGNKEFSAK 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per min. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of fullong of antibody per ml. They can be used to provide passive fimmunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno;therapy of HIV-
                                                                                    Human, Pab, variable chain, heavy, light, region, VH, VL, HIV, gpl20, 3b1; 3b3; 3b4; 3b9, MT4; humanised, monoclonal antibody; MAb; immunoreaction; neutralisation; passive immunotherapy.

Ten heavy chains which recombined with the b12 light chain and bound gp120 by panning were chosen for sequence analysis. AAR54315 was one of these heavy chains. (Updated on 25-MAR-2003 to correct PN field.)

```
The sequences given in AAW01302-11 represent the heavy chain variable regions (VI) of a series of monoclonal antibodies (NAb, 9) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the gene clone, HG12. These sequences represent heavy chains which bind to the b12 light chain clone (see also AAW01276). These sequences were isolated from the shuffled heavy chain library, Hn-L12. A WAb containing this VH

sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection. The heavy chain clones designated H2 and H14 exhibited approx. 40 % neutralisation of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a fragment of the antibodies of the invention. The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first polynucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAY98206) and a second polynucleotide encoding a light chain immunoglobulin amino acid
                                                                                                                                                                                                                                                                                                                                138
                                                                                                                                                                                                                                                                                                                                                                   120

```
sequence; (b) inserting the first and second polymucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the amino acid sequences encoded by the polymucleotides to be expressed in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The anti-HV gp-120 monoclonal antibody is used for providing passive.

Comparisons to reduce the likelihood and/or severity of HIV-induced disease immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease.

Comparisons to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV to producing anti-idiotypic antibodies which can be used for active producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of significant lost immune response to the antibodies according antibodies of xenogeneic or chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARS4244 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)

```
Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-induced disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but

                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                 ద
       amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (WAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of 100 ng of antibody per m1. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                 FQDRVTFTADTSANTAYMELKSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

                                                                                                                                                                                                                       This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAb) which is immunoreactive with HIV glycoprotein gpl20 and is capable of neutralising HIV. This sequence represents the sequence of clones b4 and b12. The MAb has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. This sequence forms the heavy chain component of MAb's with the light chain sequences given in heavy be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                               Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human neutralizing monoclonal antibodies to human immunodeficiency virus (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                     This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human The invention relates to the production of an anti-HIV (human The invention relates to the production of an anti-HIV (human of the antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first production of the antibody comprises: (b) production of the antibody comprises (a) providing a first polynuclectide encoding a light chain immunoglobulin amino acid sequence of sequence represented by AAY98206) and a second polynuclectide encoding a light chain immunoslobulin amino acid sequences in the host cell; and (d) isolating the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The antibody is used for privaliding passive in the host cell; and (d) isolating the antibody is used for privaling the heavy and likelihood and/or severity of HIV-induced disease and the patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV producing anti-idiotypic antibodies which provides information of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 control antibodies are encoded by a human polymiclectice and in wive for diagnosis and immunoacompeteric or chimeric or which man and immunoacompeteric or antibodies are encoded by a human polymiclectice and concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 concentred in wive for diagnosis and immune response to the antibodies are encoded by a human polymiclectice and concentration of an encodence of an immune response in encodence or calcagned by measuring t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The present sequence represents a fragment of an anti-human relates to immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to thuman whole immunodiballin [1g] molecule which immunoreacts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV infectivity titre in an invite of invitro virus infectivity assay by 50%, at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the dagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field immunocherapy of HIV induced disease. They are useful as neutralising communicompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the neutralising antibodies define new epitopes on the CHIV gpl20 and gpl4 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively cadministered antibodies of significant host immune response to the passively cadministered antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the derivation are utilized. An additional major advantage of the monoclonal antibodies which is a problem commonly encountered when monoclonal major advantage of the monoclonal antibodies is problem commonly encountered when the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

Monoclonal antibody binding to VI/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
HIV; human immunodeficiency virus; glycoprotein; gpl20; clone;
virus infectivity assay; precursor gp160; immunocompetence; human;
anti-HIV antibody; detection; HIV infection.
                                                                             1. .20

This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAD) which is immunoreactive with HIV glycoprotein gp120 and is capable of neutralising HIV. This sequence contains the leader sequence derived from the mouse B72.3 heavy chain, and the human VH consensus sequence attached to the N-terminal of the b12 VH sequence. Who contains a Kozak sequence for the control of VH expression. This sequence was amplified unsing the primer sequences given in AAT40889-92. A MAD containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 gp120 preferentially over the precursor gp160. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the

Sequence 146 AA;

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in virro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first of production of the antibody comprises: (b) providing a first of production of the antibody comprises: (a) providing a first of production of the antibody comprises: (b) providing a first and second polymucleotide encoding a light chain immunoglobulin amino acid sequence. (b) inserting the first and second polymucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the host cell; (d) maintaining the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and in the host cell; and (d) isolating the antibody comprising the heavy and control immunoglobulin amino acid sequences from the host cell. The antibody comprising to reduce the likelihood and/or severity of HIV-induced disease the not patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a human. They can be administered to high-risk and producing anti-diotypic antibodies which can be used for active immunoscompetence of an immune response in the body or in body fluids by immunosassay. The anti-HIV gp-120 concoloral antibodies are encoded by a human polymucleotide sequence and concoloral antibodies are encoded by a human polymucleotide sequence and in wive for diagnosis and immunocherapy of HIV-induced disease reconceded by a human polymucleotide and in wive for diagnosis and immunocherapy of HIV-induced disease reconceded by a manner response to the antibodies are encoded by a manner response to the antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human neutralizing monoclonal antibodies to human immunodeficiency viru (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120.
                                                                                                                                                      Antibody; anti-HIV monoclonal antibody; glycoprotein-120; human immunodeficiency virus type 1; HIV-1; infectivity titre; passive immunotherapy; reduce severity; HIV-induced disease; mmunocompetence; active immunisation.

The present sequence represents a fragment of an anti-human clark of immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunodebulin [1g] molecule which immunoreacts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV precursor glycoprotein computer glycoprotein gpl20 preferentially over HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the diagnosis and immunocherapy of HIV induced disease. They are useful as neutralising client isolates and provide useful information regarding the immunocherapy of HIV induced disease. They are useful as neutralising cimmunocherapy of HIV induced disease. They are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the neutralising antibodies. A major advantages of the HIV gpl20 and gpl glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies which is a problem commonly encountered when commonly encountered antibodies which is a problem commonly encountered when monoclonal antibodies of sangement or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies sequence. Thus in a problem commonly escential and continued they immunored with a unique determinant present on mature HIV glycoprotein gpl20. This class of All produces is particularly effective at neutralising field isolates of All produces at neutralising field isolates of All produces at neutralising field isolates of All produces at neutralising field isolates of All produces.
                                                                   120

```
cc polypeptide from which the motif is derived, where the resulting hybrid CC infectious conformer of the polypeptide that is the source of the polypeptide that is the source of the polypeptide that is the source of the polypeptide that is the source of the polypeptide motif compared to a benign form of the polypeptide. Also described: (1) a nucleic acid molecule, (3) a cell comprising the vector; (4) detecting an isoform or a PreSc form of a prion polypeptide or a comprising the nucleic acid molecule, (3) a cell comprising the vector; (4) detecting an isoform or a PreSc form of a prion polypeptide or a comprising the vector; (5) a solid support comprising a plurality of polypeptide associated with a disease of protein aggregation; (7) preparing a hybrid molecule of with a disease of protein aggregation; (8) an anti-idiotype antibody that specifically interacts with one conformer of a prion protein. (1) has the disease mentioned above; and (8) an anti-idiotype antibody that concuprotective, notorpolo, antidiabetic, antionvalued in the cerebroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, cerebroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, cerebroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, conformation, such as creutzfeldt-Jaxob disease, scrapie and bovine conformation, such as creutzfeldt-Jaxob disease, preactive amyloidosis associated with autosomellominamyloidosis, reactive amyloidosis associated with autosomal dominant inheritance of variant conformated mith chronic inflammatory disease, hereditary systemic amyloidosis, sasociated with autosomal dominant inheritance of variant cardiance with chronic inflammatory disease, hereditary systemic amyloidosis associated with autosomal dominant inheritance of variant cardiance with a disease, prontocremporal dementia, multiple myloidosis associated with autosomic conformation and methods of the present failure, conformal panyloidosis, chronic renal failure, congestive heart failure, engarcinoma of a famil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The invention relates to a recombinant adeno-associated virus (rAAV)/
IgG1b12 or rAAV/ScFvX5 genome. The rAAV is useful for gene delivery,
particularly in delivering antibody genes to target cells in mammals. The
antibodies may be used to prevent and/or treat viral infections
(particularly HIV), bacterial infections and other chronic disease states
(e.g. cancer, rheumatoid arthritis, inflammation, fatal familial
insomnia, kuru, Mad Cow Disease or Alpers syndrome). The present sequence
represents the human monoclonal antibody (MAD) IgG1b12 heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preffered His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (WAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      60

using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XiI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARS4245 neutralises HIVI gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FQDRVTFTADTDANTAYMELRSLRSADTAIYYCARVGPYTWDDSPQDNYYMDVMGKGTKV 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 LEGSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK

The sequences given in AAW01233-60 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JHG gene clone, b7. A MAb containing this VH sequence has the capacity to reduce the UT infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ag of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for determining immunocompetence of a human anti-HIV antibody and in the Monoclonal antibody binding to V1/V2 loop of HIV gpl20 - used in passive immuno:therapy and detection of HIV infection. Example; Fig 10; 366pp; English.

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human content on relates to the production of an anti-HIV (human content on the production of an anti-HIV (human content on its productional antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity cassay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first content on the antibody comprises: (b) production of the antibody comprises: (c) production a direction of the antibody comprises: (a) providing a first content of the antibodic encoding a light chain immunoglobulin anino acid sequences (b) inserting the first and second polymucleotide sequences (c) in the lost cell; (c) maintaining the host cell; in conditions which allow the amino acid sequences encoded by the polymucleotide sequences in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The anti-HIV gp-120 monoclonal antibody is used for providing passive content to patients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for meutralising field isolates which provides information about the munocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human neutralizing monoclonal antibodies to human immunodeficiency viri

ö
immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
                                                                                                                                                                                                                                                                                                                                                   120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunoglobulin (1g) molecule which immunoracts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl60 and neutralises HIV and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the
                                                                                                                                                                                                                                                                                                                                                                       60

immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gpl20 and gpl41 glycoproceins, thus increasing the availability of new monoclonal antibodies derives from the fact that they are encoded by a muman polynucleotides sequence. Thus in vivo use of the monoclonal antibodies of significant host immune response to the passively reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (NAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They neutralise HIV more effectively immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠે
                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preffered His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAB) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

ö
                                                                                                                                                                                                lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dictistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARA4246 neutralises HIVI gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LEQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK 60

The sequences given in AAW01233-60 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gpl20 and are capable of the JH6 neutralising HIV. This sequence represents the sequence of the JH6 gene clone, b21. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml, and binds mature gpl20 determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection
                                                                                                    Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gpl20; clone; virus infectivity assay; precursor gp160; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monoclonal antibody binding to VI/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        97.3%; Score 656; DB 2; Length 124; larity 96.0%; Pred. This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HV (human immunodeficiency virus) glycoprotein (9p)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first comprises the argument of providing a first comprise the sequence represented by AAY98206) and a second polymucleotide encoding a light chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAY98206) and a second polymucleotide encoding a light chain immunoglobulin amino acid sequence (b) inserting the sequence represented by AAY98206) and a sequence; (b) inserting the host cell in conditions which allow the nost cell; and (d) isolating the antibody comprising the heavy and in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin antibody is used for providing passive in the most cell; and (d) isolating the antibody comprising the heavy and light chain immunoclonal antibody is used for providing passive immunotherapy to HIV in a human. They can be administered to high-risk parients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the producing anti-idiotypic antibodies himmunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV printed when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of

The invention relates to a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gp120 preferentially over HIV precursor glycoprotein gp160 and neutralises HIV and which reduces HIV infectivity tire in an opid and neutralises HIV and which reduces HIV infectivity it is in an invitro virus infectivity assay by 50% at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the entralising monoclonal antibodies are useful for producing anti-idotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the HIV gp120 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the

```
monoclonal antibodies derives from the fact that they are encoded by a human polynucleotides sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of xenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IVSS 124
                                                                                                                                                                                                                                                                                                            Sequence 124 AA;
```

```
The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per all. They neutralise HIV more effectively immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino scids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (WAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nor randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FODRVIFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The Fab's half, 3B4 and 3B9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of form of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The Fab's 3h, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of fillong of antibody per ml. They can be used to provide passive timmunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

It is used in a novel chimeric immunotoxin, that comprises an anti-gp120 antibody, having binding specificity to 3B3(FV) antibody, that is attached by a connector peptide to a cytotoxic molety, PB38 derived from P.aetruginosa. The chimeric immunotoxin is used in the treatment of HIV-1 infections. It is capable of specifically texgeting and killing cells displaying HIV-1 spp120 coat protein. They can be used ex vivo to reduce and/or eliminate the HIV viral load in the infected cells. It can also be used in the immunotoxins can also be used for detecting the presence or absence and for quantifying the infected cells

Ten heavy chains which recombined with the bl2 light chain and bound gpl20 by panning were chosen for sequence analysis. AAR54335 was one of these heavy chains. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The sequences given in AAW01302-11 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (WAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the geneclone, HC12. These sequences represent heavy chains which bind to the b12 light chain clone (see also AAW01276). These sequences were isolated from the shuffled heavy chain library, Hu-112. A WAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/HI, and binds mature gp120 preferentially over the precursor gp160. The WAb may be used for determining immunocompetence of a human

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiancy virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity correction of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first produced for the polynucleotide encoding a leaf cian immunoglobulin anino acid sequence (which does not comprise the sequence represented by ANY98206) and a sequence; (b) inserting the first and second polynucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell; and (d) isolating the antibody comprising the heavy and inthe HIV gp-120 monoclonal antibody is used for providing passive anti-HIV gp-120 monoclonal antibody can be administered to high-risk immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease
                                                                                                                                                                                                                                                                                              0
anti-HIV antibody and in the detection of HIV infection. The heavy chain clones designated H2 and H14 exhibited approx. 40 % neutralisation of HIV in a syncytia assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09
                                                                                                                                                                                                                                                                                                                                                                                                                                     64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human neutralizing monoclonal antibodies to human immunodeficiency virus (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV

and to patients who are already HIV-infected. The antibodies are used for immunocompetence of an immune response in Flormation about the in a biological fluid or issue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclohal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
